The following VisualAPL script was created to contain (and if desired save, edit and recall) the APL function 'GetHashTableValues'. A VisualAPL script is somewhat analogous to a workspace in legacy APL implementations. VisualAPL scripts can easily be compiled as a Microsoft .Net assembly which will interoperate with any other .Net language. In this function we have chosen to use a familiar C# code snippet readily available on the Internet to access the functionality of the .Net Hashtable data type.

```
// Script: myScript created on 8/30/2008 2:57:12 PM by Joe Blaze

∇Z←GetHashTableValues ht
{    Z←0⍴⊂''
   en←ht.GetEnumerator();
   while (en.MoveNext())
      {
      Z←Z,⊂en.Value.ToString();}
}
```
