

VisualAPL for Visual Studio 2008: APL Font

VisualAPL is Unicode-based and uses the APL glyphs which are inherently a part of the Unicode character set. Not all Unicode fonts have implemented all elements of the Unicode character set. APLNext LLC provides the “APLNext.ttf” font which does have the APL glyphs implemented.

From <http://forum.apl2000.com/posting.php?mode=editpost&p=1634> download the “APLNext_Font.zip” file and unzip the “APLNext.ttf” contained in that file.

Install the “APLNext.ttf” font to your machine using the Microsoft Windows font installation dialog. This procedure varies with the Windows operating system in use on your machine. For the Vista operating system, it may be necessary to install the font using an account in the Administrator user group.

From the Visual Studio 2008 main form use the Tools > Options menu item to display the Visual Studio Options dialog:

In the left window select the ‘Environment > Fonts and Colors’ option.

In the right window select “[All Text Tool Windows]” in the “Show settings for:” list control.

In the right windows select the “APLNext” font in the “Font” combo control.

Click the “Ok” button to apply this modification to your copy of Visual Studio 2008.
