

## VisualAPL for VS2008

The meaning of the “Unable to cast...” error message is that the operation on the specified data type has not been implemented. Depending on the specific data types involved, it may be possible to implement the operation in a future version of VisualAPL.

For example, the dyadic “jot dot op” operation has not been implemented in VisualAPL for the string data type, but it has been implemented for the integer and double data types.
