Overview

The APLNext.AppSvrController is a .Net assembly which exposes an ActiveX component with properties and methods which can be used via the APL+Win ActiveX interface to perform administration functions on an installed version of APLNext Application Server. The tool supports most of the functionality of the APLNext Application Server Administration tool GUI.

A previous version of this tool (aplcm.dll based on .Net 1.x) was associated with the APL2000 Web Services product, both of which are no longer supported.

Requirements

The target workstation must have:

- Microsoft .Net Framework 4.0 (full version) or subsequent version installed
- APLNext Application Server 4.0.22 or subsequent version installed
- APL+Win v10 or subsequent version if APL+Win will use the APLNext.AppSvrController via the ActiveX Interface

Installation

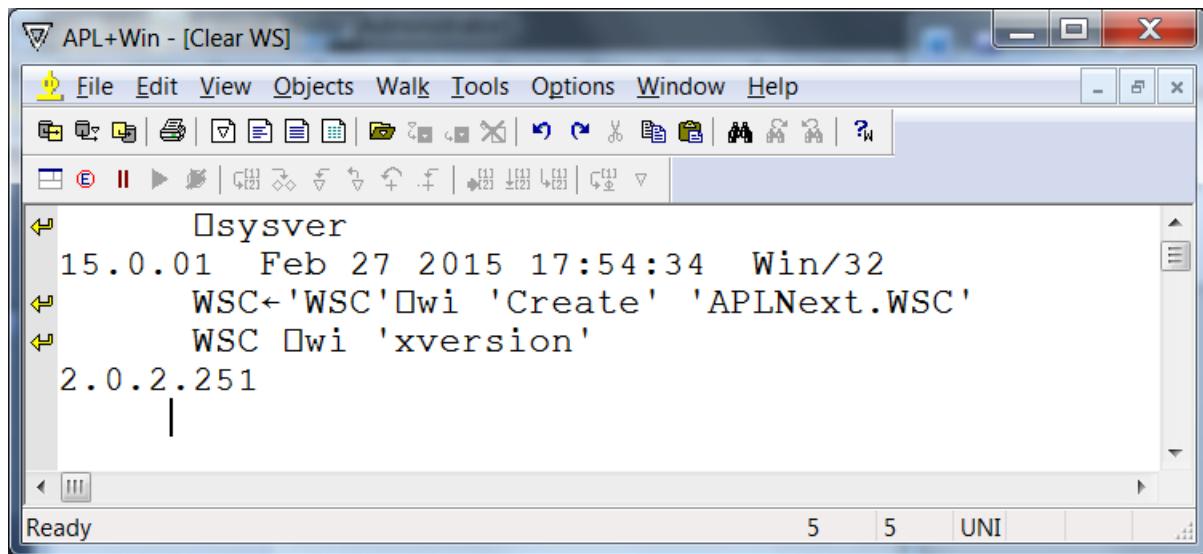

It is recommended that the APLNext.AppSvrController_Setup.exe be used to install this tool. Options for silent install and other installation options are incorporated in the installer. Since the tool requires registration as an ActiveX component, the installer may need to be run with elevated privileges.

Alternatively the application system developer may incorporate the installation and registration into a custom installer or manually perform this step:

- Copy the required .Net assemblies (APLNext.AppSvrController.dll and APLNext.XMLValidation.dll) to the target machine
- Register the APLNext.AppSvrController.dll as ActiveX using the appropriate version of the Microsoft regasm.exe program

Creating an Instance of APLNext.AppSvrController in APL+Win

This screen capture illustrates this process from the APL+Win programmer session. Analogous statements can be included in an APL+Win function that can be run in the developer or run-time version of APL+Win. The 'progId' of the APLNext.AppSvrController is 'APLNext.WSC'.

The screenshot shows the APL+Win application window titled "APL+Win - [Clear WS]". The menu bar includes File, Edit, View, Objects, Walk, Tools, Options, Window, and Help. The toolbar contains various icons for file operations. The main pane displays the object model for "sysver". The tree view shows the following structure:

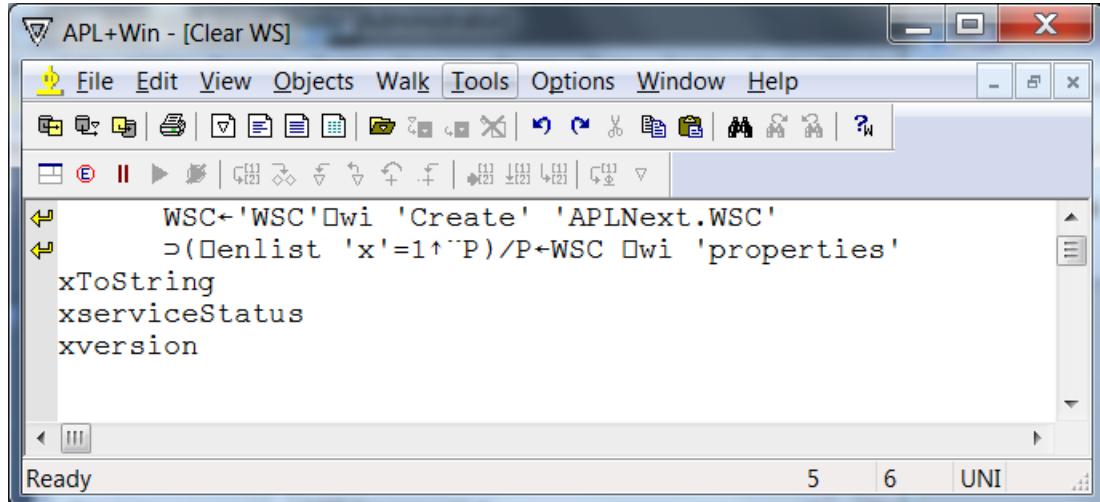

- sysver
- 15.0.01 Feb 27 2015 17:54:34 Win/32
- WSC←'WSC'□wi 'Create' 'APLNext.WSC'
- WSC □wi 'xversion'
- 2.0.2.251

The status bar at the bottom indicates "Ready" and has buttons for 5, 5, UNI.

The Object Model of APLNext.AppSvrController

The object model includes properties and methods which correspond to the manually-accessible properties and methods of the APLNext Application Server Administration Tool GUI.

Properties

The screenshot shows the APL+Win application window titled "APL+Win - [Clear WS]". The menu bar includes File, Edit, View, Objects, Walk, Tools, Options, Window, and Help. The toolbar contains various icons for file operations. The main pane displays the properties of "APLNext.AppSvrController". The tree view shows the following properties:

- WSC←'WSC'□wi 'Create' 'APLNext.WSC'
- ▷(□enlist 'x'=1↑''P)/P←WSC □wi 'properties'
- xToString
- xserviceStatus
- xversion

The status bar at the bottom indicates "Ready" and has buttons for 5, 6, UNI.

xToString Property

This property is generally not used by APL+Win, but is available by default since the tool is implemented in C#.

xserviceStatus Property

Syntax: WSC □wi 'xserviceStatus'

Arguments: None

Result: string: 'APLNextApplicationServer is stopped' or 'APLNextApplicationServer is started'.

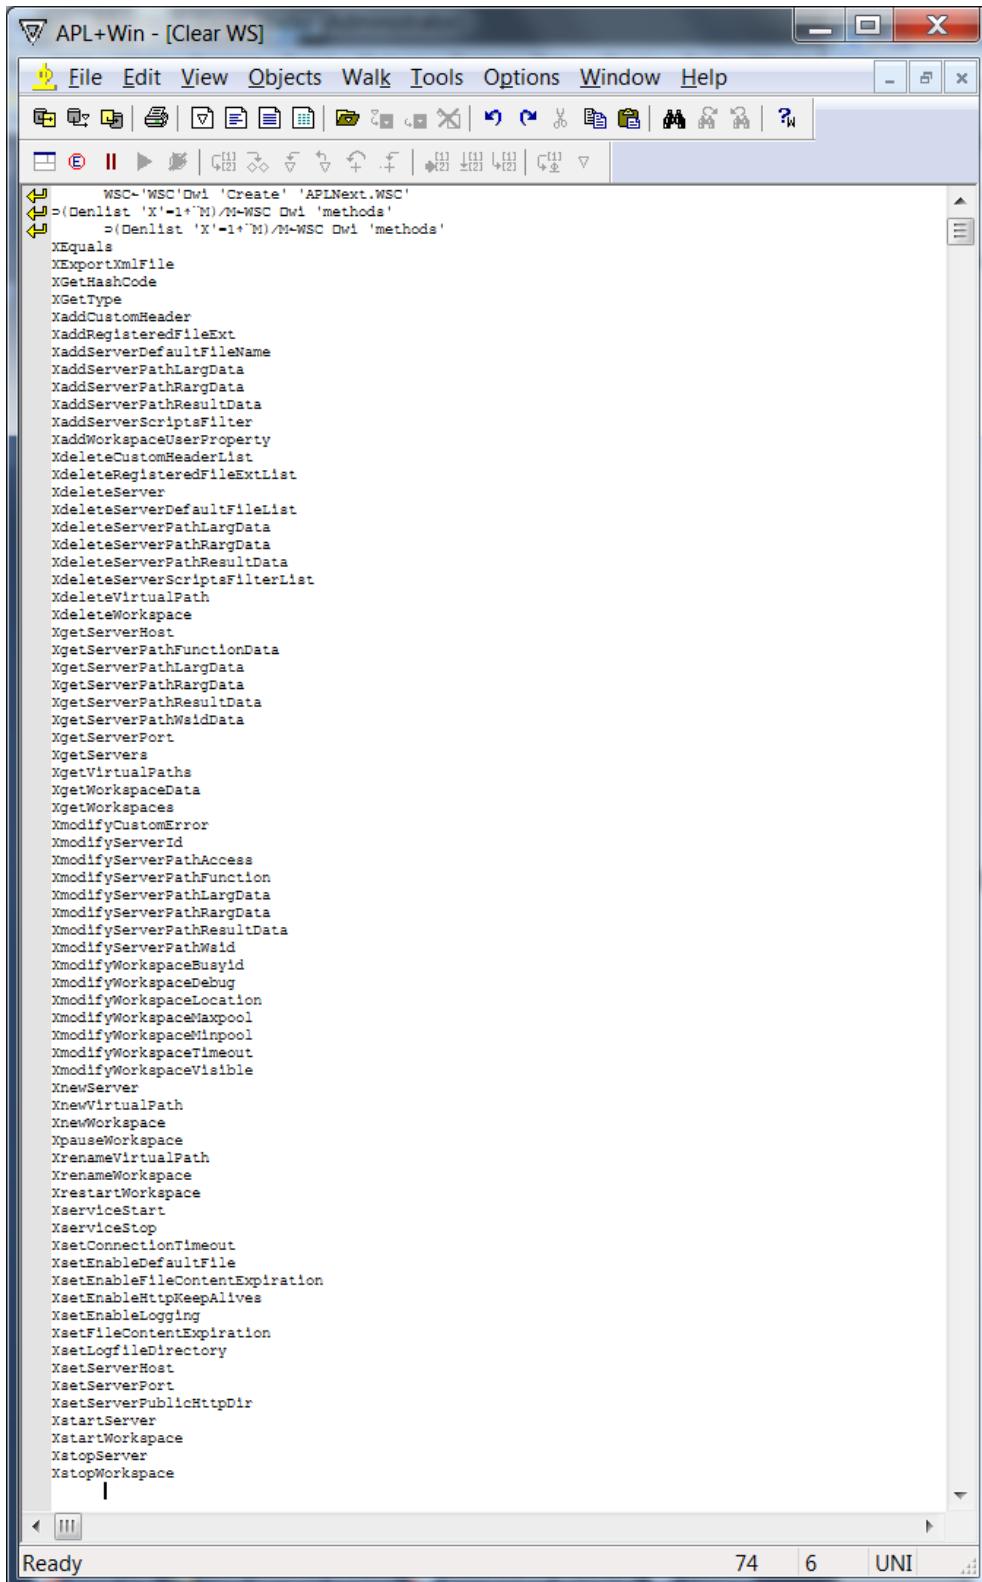

Xversion Property

Syntax: WSC □wi 'xversion'

Arguments: None

Result: string: Current Windows-format version of the tool, e.g. '2.0.2.251'

Methods

The screenshot shows the APL+Win application window titled "APL+Win - [Clear WS]". The main area displays a list of methods, which are listed below:

```
WSC->'WSC'Dwi 'Create' 'APLNext.WSC'
W->(Denlist 'X'-1+M)/M-WSC Dwi 'methods'
W->      >(Denlist 'X'-1+M)/M-WSC Dwi 'methods'

```

XEquals

This method is generally not used by APL+Win, but is available by default since the tool is implemented in C#.

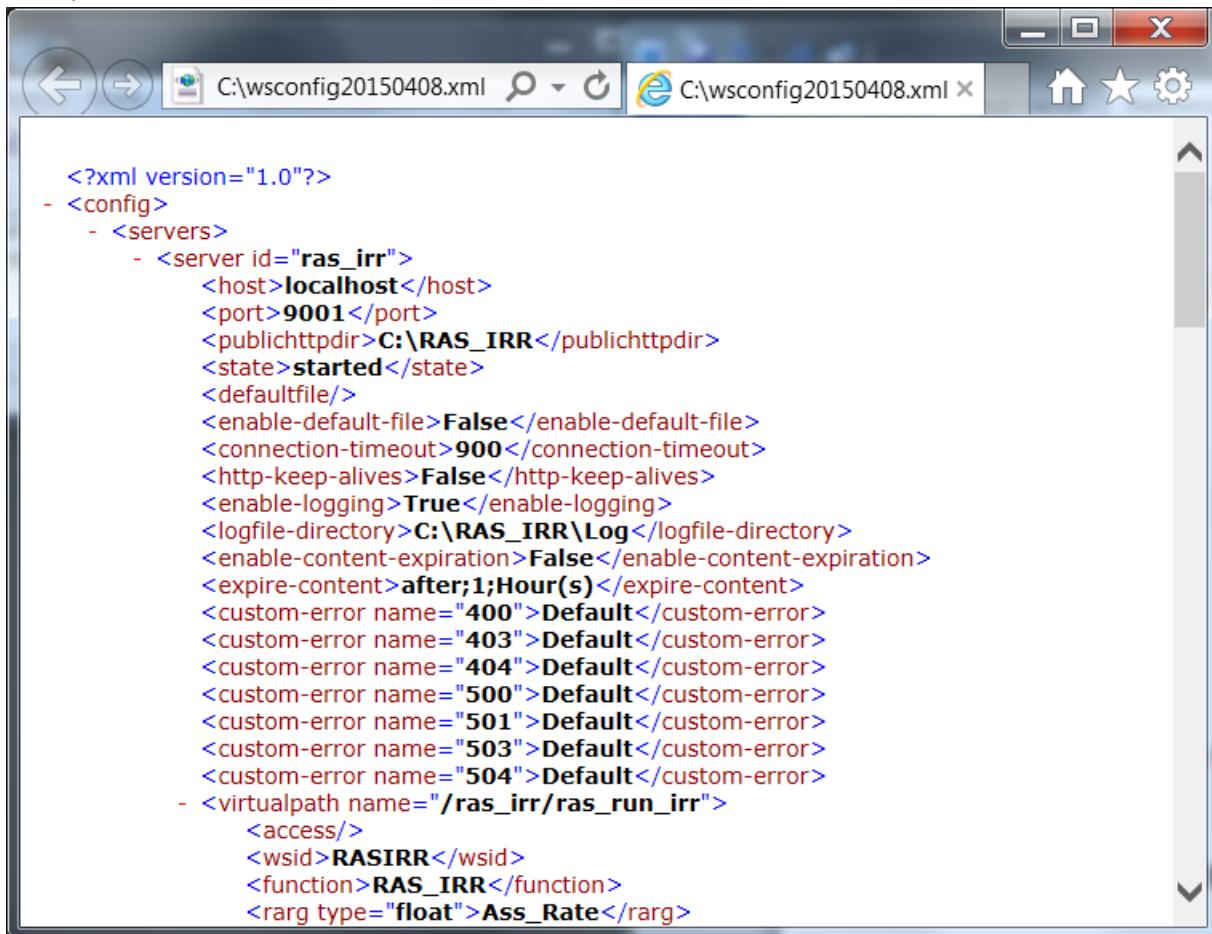

XExportXmlFile

Syntax: WSC[]wi 'XExportXmlFile' stringFullFilename

Arguments: string: full filename of target file to contain xml-format result

Result: xml-format string written to the target filename containing the current configuration of instance of APLNext Application Server on the host machine.

Example:

The screenshot shows a Windows application window titled 'C:\wsconfig20150408.xml'. The window contains a large block of XML code representing the configuration of the APLNext Application Server. The XML includes details such as server ID ('ras_irr'), host ('localhost'), port ('9001'), public HTTP directory ('C:\RAS_IRR'), state ('started'), and various custom error definitions for HTTP status codes like 400, 403, 404, 500, 501, 503, and 504. It also defines a virtual path ('/ras_irr/ras_run_irr') with specific access rules and function mappings.

```
<?xml version="1.0"?>
- <config>
  - <servers>
    - <server id="ras_irr">
      <host>localhost</host>
      <port>9001</port>
      <publichttpdir>C:\RAS_IRR</publichttpdir>
      <state>started</state>
      <defaultfile/>
      <enable-default-file>False</enable-default-file>
      <connection-timeout>900</connection-timeout>
      <http-keep-alives>False</http-keep-alives>
      <enable-logging>True</enable-logging>
      <logfile-directory>C:\RAS_IRR\Log</logfile-directory>
      <enable-content-expiration>False</enable-content-expiration>
      <expire-content>after;1;Hour(s)</expire-content>
      <custom-error name="400">Default</custom-error>
      <custom-error name="403">Default</custom-error>
      <custom-error name="404">Default</custom-error>
      <custom-error name="500">Default</custom-error>
      <custom-error name="501">Default</custom-error>
      <custom-error name="503">Default</custom-error>
      <custom-error name="504">Default</custom-error>
    - <virtualpath name="/ras_irr/ras_run_irr">
      <access/>
      <wsid>RASIRR</wsid>
      <function>RAS_IRR</function>
      <rarg type="float">Ass_Rate</rarg>
```

XGetHashCode

This method is generally not used by APL+Win, but is available by default since the tool is implemented in C#.

XGetType

This method is generally not used by APL+Win, but is available by default since the tool is implemented in C#.
